中華民國一百零一年六月
謝辭

時光飛逝，兩年的研究生活晃眼及過，這段期間的學習和研究，首先感謝這兩年來對我苦口婆心說教的指導老師-翁豐富副教授，在老師嚴謹要求做事的態度、方法、邏輯以及解決問題的能力，使我增加進入職場上所需的能力，心中感謝老師這兩年來的指導與教誨。在論文口試時，蒙嘉義大學陳清玉教授與本校的莊聲宏所長，對本論文辛苦的審查，惠與寶貴的意見與指正，使本論文得以更臻完善，僅此致敬最誠摯的謝意。

研究期間首先感謝藥化所提供良好的實驗環境及設備，像是抽氣罩、中央真空系統以及走廊環境改善，並蒙郭盛助講座教授、莊聲宏所長、黃麗嬌教授以及所上各位老師的關懷指導，還有龔語慧小姐這兩年行政及大小事務上的幫忙，接著感謝所上的眾多學長姐在實驗及儀器使用上的指導，最後感謝黃俞穎學長、王麗雅學姊、張濬璽學弟一路上也幫了不少的忙，在此致上謝意。

最後感謝我的父母，因為我一路讀到研究所，感謝您們不辭辛苦的為我賺取學費，使我未來步入社會時無負債的壓力，我的成就都是來自你們給予的無條件的包容與支持，讓我面對挫折時可以無後顧之憂向前邁進。這兩年來承蒙太多人的幫助與鼓勵，僅將此份論文獻給所有關心我的親朋好友，共同分享這份成果及喜悅。

中文摘要

本論文是利用微波加速化學反應及化學選擇性控制方法，合成出 1H-pyrazol-5-yl-N,N-dimethyl-formamidine 和 pyrazolyl-2-azadiene 的兩類化合物，將 5-amino-1,3-diphenyl pyrazole，1H-pyrazol-5-yl-N,N-dimethyl-formamidines，pyrazolyl-2-azadiene，5-amino-4-formylpyrazoles 四類具構效關係的化合物經由藥理活性篩選 (NCI-H661，NPC-TW01，Jurkat)。

其結果顯示 1H-pyrazol-5-yl-N,N-dimethylformamidines 衍生物 2b，2c，2d 具較佳的藥理活性 (IC₅₀: 6.0~9.2μM)，從藥理活性也指出在 pyrazole derivatives 須同時擁有 amidinyl 與 formyl 官能基才能增強藥理活性。
Abstract

Chemoselective microwave-assisted amidination was successfully developed to alternatively synthesize 1H-pyrazol-5-yl-\(N,N\)-dimethyl-formamidine and pyrazolyl-2-azadiene two classes compounds. All of the starting materials and resulting products were tested against NCI-H226, NPC-TW01, and Jurkat cancer cell lines to evaluate their difference in antiproliferative activities for realizing the structure activity relationship study.

Following the SAR result, 1H-pyrazol-5-yl-\(N,N\)-dimethylformamidine compounds 2b, 2c and 2d possessed the best potent with IC\(_{50}\) values in low micromolar range. On the other hand, we found that the formyl group at C-4 position and the grafted amidinyl group in the main core of pyrazolic molecule were necessary for the inhibitory activity.
Chapter 1 Introduction

Pyrazoles attract attentions due to their wide range of pharmacological properties; such as anti-asthmatic,\textsuperscript{1} antibacterial,\textsuperscript{2} anti-inflammatory,\textsuperscript{3} antifungal,\textsuperscript{4} anticancer,\textsuperscript{5} antiviral,\textsuperscript{6} anticonvulsant,\textsuperscript{7} and antimicrobial.\textsuperscript{8}

The bioactivities of functionalized $N$-arylpyrazoles have been extensively studied\textsuperscript{9} and the C-5 substituted pyrazoles are also explored in the design of pharmaceuticals and agrochemical agents.\textsuperscript{10}

Michael J. Genin\textsuperscript{11} in 2000 reported that novel 1,5-diphenylpyrazole nonnucleoside HIV-1 Reverse Transcriptase inhibitors, PNU-32945 and 1,5-Diphenyl-3-(2-hydroxyethyl)-4-ethylpyrazole (Figure 1), were found to have excellent activity versus delavirdine-resistant P236L\textsuperscript{12} ($IC_{50} = 1.1 \ \mu M$) reverse transcriptase (RT) for inhibition of viral replication in cell cultures.

\end{figure}

Recently, the studies of pyrazole derivatives focus on antibacterial, antifungal, and anticancer as their key utilization.
Section 1.1 Pyrazoles derivatives as Antibacterial Lead Compound

Akihiko Tanitame\textsuperscript{2a} used a new screening system for the specific inhibitors of chromosome partitioning in \textit{Escherichia coli},\textsuperscript{13} and had previously reported that 4-piperidyl moiety in pyrazole ring and 1-(3-chlorophenyl)-5-(4-phenoxyphenyl)-3-(4-piperidyl)pyrazole (Figure 2) having a piperidine ring represents a series of bacterial DNA gyrase inhibitors that have effective antibacterial activity against \textit{Staphylococcus aureus} and \textit{Enterococcus faecalis}.\textsuperscript{14} Akihiko Tanitame have also demonstrated that 1-(3-chlorophenyl)-5-(4-phenoxyphenyl)-3-(4-piperidyl)pyrazole (Figure 2), shows improved DNA gyrase inhibition and target-related antibacterial activity.\textsuperscript{13a} Moreover, 4-piperidyl moiety in pyrazole ring and 1-(3-chlorophenyl)-5-(4-phenoxyphenyl)-3-(4-piperidyl)pyrazole had the similar inhibitory values against clinically isolated multidrug resistant Gram-positive bacteria with a minimal concentration.

![Pyrazoles derivatives](image1.png)

**Figure 2.** Pyrazoles derivatives as antibacterial agent
Akihiko Tanitame transformed piperidyl functional group of 1-(3-chlorophenyl)-5-(4-phenoxyphenyl)-3-(4-piperidyl)pyrazole to other functional groups and evaluated their antibacterial activity in vitro (Table 1).

*MIC: Minimum inhibitory concentration*
The emergence of bacterial strains with resistance to currently marketed antibacterial agents has promoted interest in the discovery of novel antibacterial agents with novel modes of action.\textsuperscript{15} One set of potential new targets are the family of bacterial amino acyl-tRNA synthetases.\textsuperscript{16} These enzymes are necessary for bacterial growth and have been validated as drug targets by the research and development of pseudomonic acid, whose mode of action is the inhibition of bacterial isoleucinyl tRNA synthetase.\textsuperscript{17}

Some of a broad program to discover bacterial tRNA synthetase inhibitors,\textsuperscript{18} 1\textit{H}-3-carboxylic acid-5-(2',4'-dichloro[1,1'-biphenyl]-4-yl)-1-(2,4-dichlorophenyl)pyrazole (Figure 3) was determined as an inhibitor of methionyl-tRNA synthetase (MetRS) by high-throughput screening.\textsuperscript{19} It is a modest micromolar inhibitor of the bacterial MetRS enzyme from two important Gram positive bacteria, \textit{Staphylococcus aureus} and \textit{Enterococi faecalis} (SaMetRS and EfMetRS) but at same time it also inhibits human MetRS (hMetRS) at similar concentrations. As a result, in 2003, John Finn report that novel compounds with improved potency on bacterial MetRS and selectivity versus hMetRS.\textsuperscript{2b}

![Figure 3. Pyrazoles derivative as antibacterial agent](image)
John Finn\textsuperscript{2b} synthesized a series of pyrazoles with significantly improved potency on reducing bacterial methionyl-tRNA synthetase and had less effect on human methionyl-tRNA synthetase (Table 2).

Optimization of a micromolar pyrazole enhance it’s selective antibacterial factor and further provided a set of submicromolar 1\textit{H}-3-tetrazole-5-(2',4'-dichloro[1,1'-biphenyl]-4-yl)-1-(2,4-dichlorophenyl)-Pyrazole. This compounds have significantly enhanced selectivity for the bacterial MetRS enzyme as compare the human MetRS enzyme. The advances in potency and selectivity for the pyrazole series suggests that MetRS may be a potential and selectivity target for discovering other series of inhibitors.

Section 1.2 Pyrazoles derivatives as Antifungal Lead Compounds

Pyrazophos,\textsuperscript{4a} (Figure 4) the first fungicide of this class to be commercialized, was marketed by Hoechst AG in 1974 to control powdery mildew in vegetables, and many pyrazole derivatives are now commercially available. The advantages, such as a new mode of action, wide spectrum, low toxicity toward mammalian cells, and favorable profiles to humans, have prompted chemists to design and synthesize novel pyrazole derivatives.

Recently, pyrazole compounds, such as Furametpur, Penthiopyrad and Pyraclostrobin (Figure 5), have been found to have potential antifungal activities for the control of some plant diseases. With growing applications on their synthesis and bioactivity, chemists and biologists in recent years have paid more attention to the research of pyrazole derivatives\textsuperscript{20} (Figure 5).
Synthesis of flavonols having C-2 position moiety in pyrazole was recently reported as potent antifungal and antibacterial agents.\textsuperscript{21,21b} Furthermore, the presence of enone function in chalcone moiety with pyrazole ring also increased the biological activity.\textsuperscript{22}

Babasaheb P. Bandgar\textsuperscript{4b} reported the synthesis and biological activity of pyrazole chalcones as antifungal agents. The toxicity of the compounds was evaluated theoretically and experimentally have been defined their potential as safe leading compounds for bioavailability (Table 3).

Section 1.3 Pyrazoles derivatives as Anticancer Lead Compounds

In 2011, Alessandro Balbi\textsuperscript{5a} studied novel pyrazole derivatives on their antiproliferative activity in human ovarian adenocarcinoma A2780 cells and murine P388 leukemia cells (Table 4). In particular, three compounds were active on human ovarian adenocarcinoma A2780 (\(p < 0.001\)) and murine leukemia P388 cells (\(p < 0.001\)) (Table 4).

Histone deacetylases (HDACs)\textsuperscript{23} are widely established enzymatic targets for multiple therapeutic applications.\textsuperscript{24} It is well accepted that therapeutic application of HDAC inhibitors depends on their isoform selectivity profile\textsuperscript{25} and their HDAC class, making isoform selective inhibitors an important issue in the design and development of novel HDAC-based therapeutics.

In 2011, Pavel A. Petukhov,\textsuperscript{5b} reported that diazide inhibitors for the two class I isoforms HDAC8 and HDAC3 may have particular value for the treatment of neuroblastoma, leukemia,\textsuperscript{26} and gastric, prostate, and colorectal cancer.\textsuperscript{27} And he found that novel diazide-containing pyrazole-based Histone deacetylase inhibitors have low nanomolar inhibitory activity against HDAC3 and HDAC8. The pyrazole-based inhibitor, \textit{Octanedioic Acid [1-(3-Azido-5-azidomethylbenzyl)-1H-pyrazol-4-yl]amide Hydroxyamide}, exhibit one of the most active HDAC8 inhibitors reported in the literature with an IC\textsubscript{50} of 17 nM (Table 5).

Section 1.4 Improved bioactivities by Amidinyl Group

Amidine analogue of melphalan and AB4 (Figure 6) have been found to have anticancer activity by decreasing the number of viable cells in both estrogen receptor-positive (MCF-7) and estrogen receptor-negative (MDA-MB-231) breast cancer cells. Although the cytotoxicity was concentration-dependent to both cell lines, it was more pronounced to MDA-MB-231 than in MCF-7. Anticancer activity of AB4 was shown to be more potent than melphalan in both MDA-MB-231 and MCF-7, with IC₅₀ values of 45 ± 2 and 62 ± 2 µM, respectively. Comparative to AB4, melphalan²⁸ required higher concentration 130 ± 2 and 125 ± 2 µM for MDA-MB-231 and MCF-7.

![Melphalan and AB4](image)

**Figure 6.** Melphalan and AB4

Introducing an amidino group into the core molecule to enhance its antibacterial activity²⁹ are still the subject of interest, such as penicillin. Moreover, antibiotic such as anthracycline (Figure 7) was shown to decrease toxicity and enhance anticancer activity.³⁰ Similarly, amidine group in mecillinam (Figure 7) inhibited
Escherichia coli, Klebsiella spp., Enterobacter spp., Citrobacter spp., Shigella spp., and Salmonella spp. with a mean minimum inhibitory concentration of 16/µg/mL.  

Figure 7. Anthracycline and mecinlinam
Section 1.5 Antiproliferative of Formylated Amidinyl Pyrazole Derivatives

Our laboratory had previously developed a new microwave-assisted amidination method by treating various primary amines including aromatic amines and pyrazol-5-amines with amide solvents and POCl₃ coupling agent. Based on our experimental data, the yielding formylation amidinyl pyrazole products seemed to be determinated by the dissociation of the substituting amides.

Based on the growth inhibitory activity data, compounds with m-Cl-Ph and p-Br-Ph groups at N-1 position and compounds with p-Me-Ph and p-Cl-Ph groups at C-3 position in pyrazolic ring possessed the most potent activity. In addition, the formyl group at C-4 position in the core pyrazolic ring is indispensable for the inhibitory activity (Table 6).³²

Chapter 2  Research Approach

In 2010, our laboratory developed a newly microwave-assisted amidination method to prepare methnimidamide compounds by using 5-amino-1,3-disubstituted pyrazoles, amide solvents, and POCl₃. According to the growth inhibitory activitive data, compounds with m-Cl-Ph and p-Br-Ph groups at N-1 position and compounds with p-Me-Ph and p-Cl-Ph groups at C-3 position in pyrazolic ring showed the most potent activity.

Herein, we reported a new chemoselective microwave-assisted amidination method to synthesize 1H-pyrazol-5-yl-N,N-dimethylformamidines (Figure 8) and pyrazolyl-2-azadienes (Figure 9) by using the suitable amount of basic pyridine as the basic catalyst. The reactivity and bioactivity for the different skeletal of methnimidamides (Figure 10) and starting material 5-amino-1,3-disubstituted pyrazole (Figure 11) were also explored.

![Chemical structures](image)

**Figure 8.** 1H-pyrazol-5-yl-N,N-dimethylformamide derivatives

Figure 10. Methnimidamide derivatives

Figure 11. 5-amino-1,3-disubstituted pyrazole derivatives
Chapter 3  Result and Discussion

Results of this study showed that four series compounds including 5-amino-1,3-diphenyl pyrazole (1a–1e), 1H-pyrazol-5-yl-N,N-dimethylformamidines (2a–2e), Pyrazolyl-2-azadienes (3a–3e), and methnimidamide (4a–4e) was successfully synthesized. All of compounds were tested for structure activity relationship and biological activity.

Section 3.1 Chemistry

Our laboratory reported that if benzoylecyanonitrile was allowed to react with phenylhydrazine in neat condition at reflux for 2.0 h, it will result in the synthesis of 5-amino-1,3-diphenyl pyrazole (1a–1e). A model procedure involved the treatment of 5-amino-1,3-disubstituted pyrazoles 1a–1e with POCl₃ (~1.2 equivalent) in DMF at 30–40°C with 100 W of microwave energy within 15–20min was developed to synthesize 1H-pyrazol-5-yl-N,N-dimethylformamidines (2a–2e). The newly chemoselective methodology is applicable to transform compounds 1a–1e to the corresponding pyrazolyl-2-azadiene products 3a–3e without formyl group. A newly basic condition by using NaOH in MeOH solution was used to synthesize the de-amidination of methnimidamide (4a–4e).
Section 3.1.1 Synthesis of 5-amino-1,3-diphenyl pyrazole (1a–1e)

The traditional Synthetic method for the synthesis of 5-amino-1,3-diphenyl pyrazole was to react benzoylacetonitrile with phenylhydrazine under distinctive conditions. Distinctive conditions include: (a) heated in EtOH,\textsuperscript{34} (b) microwave irradiation,\textsuperscript{35} and (c) heated in acetic acid (Scheme 1).

The first method was refluxing benzoylacetonitrile with the same equivalent of phenylhydrazine in EtOH for \textgreater 8.0 h (see Scheme 1, path a).\textsuperscript{34} Product 5-amino-1,3 diphenyl pyrazole was generated in only 41% yield via tandem condensation and thermal cyclization. Another method was the use of microwave irradiation of benzoylacetonitrile with hydrazine in EtOH solution for \textgreater 4.0 h to provide 5 amino-1,3-diphenyl pyrazole in 58% yield (see Scheme 1, path b).\textsuperscript{35} These first two methods did not produce desired yield of 5-amino-1,3-diphenyl pyrazole. The third method was used acetic acid as the solvent could provide 75–85% yield of 5-amino-1,3-diphenyl-pyrazole (see Scheme 1, path c).

Benzoylacetonitrile was allowed to react with phenylhydrazine in neat condition at reflux for 2.0 h (see Scheme 1, path d). Our laboratory carried out the reaction in such neat condition that we successfully generated 94% yield of 5-amino-pyrazole.
Conditions
a. EtOH, reflux, >8.0 h, 41%
b. EtOH, microwave, >4.0 h, 58%
c. AcOH, temp., 75-85%
d. neat, reflux, 2.0 h, 94%

Scheme 1
Section 3.1.2 Synthesis of 1H-pyrazol-5-yl-N,N-dimethylformamidines (2a–2e)

Scheme 2 illustrates the amidination of 5-amino-1,3-diphenyl pyrazole to the corresponding and the optimization of the reaction. A model procedure involved the treatment of 5-amino-1,3-disubstituted pyrazoles 1a–1e with POCl₃ (~1.2 equivalent) in DMF at 30–40°C with 100 W of microwave energy within 15–20 min. After work-up and purification by column chromatography on silica gel, the corresponding 1H-pyrazol-5-yl-N,N-dimethylformamidines 2a–2e were readily obtained in 77–97% yields (see Table 7; Scheme 2). In addition to grafting the amidinyl group on the main core of 5-amino pyrazole, the formyl group was also introduced at the C-4 position of pyrazolic ring. Compounds 2a–2e were fully characterized by spectroscopic methods.

Section 3.1.3 Synthesis of Pyrazolyl-2-azadienes (3a–3e)

For the investigation of the effect of formyl group on activity, we evaluated the chemoselective microwave-assisted amidination methodology to prepare a series of pyrazolyl-2-azadienes 3a–3e without introducing a formyl group at C-4 position on pyrazolic ring as the comparing model. Initially, we chose 5-amino-1-3-diphenylpyrazole 1a as modeling case and treated 1a with different inorganic or organic basic agents to quench the excess amount of active iminenium species or neutralize hydrochloride for diminishing the formation of the formylated methnimidamide product 2. The bases included sodium hydroxide (NaOH), potassium carbonate (K$_2$CO$_3$), cesium carbonate (CsCO$_3$), triethylamine (NEt$_3$), dimethylaminopyrium (DMAP), and pyridine.

Firstly, the amidination reaction was performed on 5-amino-1-3-diphenylpyrazole 1a with-out basic catalytic agent as the blank study. The reaction only provided the formylated methnimidamide 2a in 94% yield.

When the reaction was treated with 2.0 equivalent of inorganic base including sodium hydroxide (NaOH), potassium carbonate (K$_2$CO$_3$), and cesium carbonate (CsCO$_3$), the methnimidamide product 3a without the formyl group was provided in poor yields, except for using cesium carbonate (see entries 2–4 of Table 8). For cesium carbonate, the methnimidamide product 3a was obtained in 78% isolated
yield with the recovery of a small amount of the starting materials 1a. On the other hand, the starting materials 1a and the small amount of the formylated methnimidamide compound 2a were simultaneously obtained in NaOH as basic catalytic agent.

![Scheme 3](image)

**Scheme 3**

When the same condition was applied to the commercially available organic bases including NEt₃, DMAP, or pyridine, the methnimidamide product 3a without formyl group was obtained in 34–82% yields as the major product (see entries 5–7 of Table 8). Particularly, the best chemoselective result was achieved by using pyridine as the basic catalyst. The use of various equivalent of pyridine was also studied from 1.0 equiv to 4.0 equiv. We found that using 3.0 equivalent of pyridine can give pyrazolyl-2-azadiene product 3a in the best yield (97% yield, see entry 9 of Table 8).
Furthermore, the newly chemoselective methodology can be applicable to compounds 1a–1e to provide the corresponding pyrazolyl-2-azadiene products 3a–3e without formyl group in 78–98% yields (see Table 9). The reliable chemoselective procedure involved the treatment of 5-amino-1,3-disubstituted pyrazoles 1a–1e with ~1.2 equivalent of POCl₃ and 3.0 equivalent of pyridine in DMF at 30–40°C with 100 W of microwave energy within 15–20 min. After work-up and purification were performed, the desired pyrazolyl-2-azadiene products 3a–3e without formyl group were obtained in 78–98% isolated yields (see Table 9; Scheme 3). Following the aforementioned studies, the chemoselective amidination reaction seemed determinate to the suitable amount of pyridine basic agent.

Section 3.1.4 Synthesis of the de-amidination of methnimidamide (4a–4e)

To identify the essentiality of amidinyl group for the inhibitory activity study, a series of de-amidination compounds 4a–4e were sequentially prepared as the comparison model for the further structure–activity relationship study. When we searched the previous reported literature about de-amidination, only one method was found by using HCl aqueous solution. However, the purification procedure was troublesome, especially in neutralization procedure.

Consequently we investigated a newly basic condition by using NaOH in MeOH solution. The reliable procedure involved the treatment of methnimidamide 2a–2e with two equivalent of NaOH at reflux in MeOH solution within 2–3 h. After the extraction work-up and simple purification through the short column chromatography on silica gel, the corresponding de-amidination 5-amino-4-formylpyrazole products 4a–4e were obtained in 83–96% yields (see Table 10; Scheme 4).

Section 3.2 Biological evaluations

The growth inhibitory activity of all amidine compounds is evaluated against a panel of human cancer cell lines, including lung carcinoma (NCI-H226), nasopharyngeal (NPC-TW01), and T-cell leukemia (Jurkat) cells. The GI$_{50}$ value is the concentration that results in a 50% decrease in the cell growth relative to an untreated control. All of starting materials 1a–1e were selected and used as the comparison model for the inhibitory activity study. Among of starting substrates, only compound 1d possessed the negligible inhibitory activity against three cell lines [the GI$_{50}$ values of 1d are 54.3 µM (NCI-H226), 80.2 µM (NPC-TW01), and 45.0 µM (Jurkat), see Table 11].

$^{a}$NCI-H226: human lung carcinoma; NPC-TW01: human nasopharyngeal carcinoma; Jurkat: human T-cell leukemia

$^{b}$All tested compounds were dissolved in 100% DMSO at a concentration of 20 mM as the stock solution. Cells were cultured without or in the presence of the methnimidamide derivatives at different concentrations for 72 h. Cell survival was determined by MTT assay. Drug molar concentration causing 50% cell growth inhibition (GI$_{50}$) was calculated. Each value represents the mean ± SD of three independent experiments.
Formylated methnimidamide 2a was also used as the comparison model for other analogs 2b–2e against the cancer cell lines. Compounds 2b and 2c containing the same m-Cl-Ph substituted group on N-1 position and either p-Cl-Ph or p-Me-Ph groups on C-3 position in pyrazolic ring displayed the better inhibitory activity against the three cancer cell lines with GI\textsubscript{50} values between 7.2 μM and 9.2 μM (see Table 12). The results also showed that they were more active against NPC-TW01 and Jurkat than NCI-H226. For compounds 2d and 2e with p-Br-Ph on N-1 position and either p-Cl-Ph or p-Me-Ph groups at C-3 position on pyrazolic ring, compound 2d showed the better inhibitory activity against the three cancer cell lines with GI\textsubscript{50} values between 6.0 μM and 8.2 μM. Due to the bulky p-Br-Ph group and p-Cl-Ph groups on the N-1 and C-3 position of pyrazole not favoring to reach the blocking side, the poor result of bioactivity was observed in compound 2e.

Following the structure activity relationship study results, compounds 2b–2d possessed the better activity than 2a and 2e. On the other hand, the antiproliferative activity data was consistent with our design approach and compound 2b–2d can be considered as the potency lead drugs.

\(^a\)NCI-H226: human lung carcinoma; NPC-TW01: human nasopharyngeal carcinoma; Jurkat: human T-cell leukemia

\(^b\)All tested compounds were dissolved in 100% DMSO at a concentration of 20 mM as the stock solution. Cells were cultured without or in the presence of the methimimidamide derivatives at different concentrations for 72 h. Cell survival was determined by MTT assay. Drug molar concentration causing 50% cell growth inhibition (GI\(_{50}\)) was calculated. Each value represents the mean ± SD of three independent experiments.
For the further the structure–activity relationship investigation, pyrazolyl-2-azadienes 3a–3e and de-amidination compounds 4a–4e were evaluated against three cancer cell lines as the comparison study. Following the antiproliferative activity result, the data indicated that compounds 3a–3e [GI$_{50}$: > 59.8 μM (NCI-H226), > 60.7 μM (NPC-TW01), and > 74.5 μM (Jurkat)] and 4a–4e [GI$_{50}$: > 8.5 μM (NCI-H226), > 28.2 μM (NPC-TW01), and > 34.4 μM (Jurkat)] were less potent than compounds 2a–2d. The experimental result in Table 13 demonstrated the formyl group at C-4 position and grating the amidinyl group toward amino moiety at C-5 in pyrazolic ring are essential for the promotion of inhibitory activity. Furthermore, the data indicated that tendency for sensitivity is nasopharyngeal (NPC-TW01) > T-cell leukemia (Jurkat) cell > lung carcinoma (NCI-H266) for methnimidamide compounds 2a–2e.

Chapter 4  Conclusion

We have successfully developed a new chemoselective microwave-assisted amidination method to prepare $1H$-pyrazol-5-yl-$N,N$-dimethylformamidines $2a$–$2e$ with the formyl group and pyrazolyl-2-azadienes $3a$–$3e$ without formylation by using pyridine as the basic agent. Furthermore, we have also evaluated the new de-amidination methodology to prepare the 5-amino-4-formylpyrazoles $4a$–$4e$ as the compared study (Figure 12).

Based on the growth inhibitory activity data, compounds $2b$, $2c$, and $2d$ with $m$-Cl-Ph and $p$-Br-Ph groups at $N$-1 position and $p$-Me-Ph and $p$-Cl-Ph groups at C-3 position in pyrazolic ring possessed the most potent activity.

Following the structure activity relationship study, we have demonstrated that introducing formyl group at C-4 position and grafting amidinyl group in the pyrazole core molecule are necessary for the improved bioactivity.

\[ X = H, m$-Cl, p$-Br \]
\[ Y = H, Me, Cl \]

Figure 12. Pyrazole compounds
Chapter 5  Experimental Section

Section 5.1 General Procedure

All chemicals were reagent grade and use as purchased. All reactions were carried out under argon or nitrogen atmosphere and monitored by Analytical thin-layer chromatography (TLC). Flash column chromatography was carried out on silica gel (230–400 mesh). Ethyl acetate and hexanes, purchased from Mallinckrodt Chemical Co., were dried and distilled from CaH$_2$. Toluene (reagent grade, from Merck Chemical Co.) was dried by distillation from CaH$_2$ under nitrogen. 4-Methylbenzoylacetonitrile, phenylhydrazine was purchased from Acros Chemical Co. 4-Bromophenylhydrazine hydrochloride, 4-chlorobenzoylacetonitrile, 3-chlorophenylhydrazine hydrochloride was purchased from Alfa Aesar Chemical Company. Benzoylacetonitrile were purchased from TCI. N,N-Dimethylformamide, pyridine were purchased from Scharlau Chemical Co. Phosphorylchloride were purchased from FERAK Chemical Co.

TLC was performed on precoated plates (silica gel 60 F-254) purchased from Merck Inc. Mixtures of ethyl acetate and hexanes were used as eluants. Infrared (IR) spectra were measured on a Bomem Michelson Series FT-IR spectrometer. The wavenumbers reported are referenced to the polystyrene absorption at 1601
cm$^{-1}$. Absorption intensities are recorded by the following abbreviations: s, strong; m, medium; w, weak. Proton NMR spectra were obtained on a Bruker (200 MHz or 400 MHz) spectrometer by use of CDCl$_3$ as solvent. Carbon-13 NMR spectra were obtained on a Bruker (75 MHz or 100 MHz) spectrometer by used of CDCl$_3$ as solvent. Carbon-13 chemical shifts are referenced to the center of the CDCl$_3$ triplet (δ 77.0 ppm). Multiplicities are recorded by the following abbreviations: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; $J$, coupling constant (Hz).

Microwave irradiation instrument was purchased from CEM Discover. The microwave irradiation condition was set in 100 W at 30–40 ºC within 10–20 min. ESI-MS spectra were obtained from an Applied Biosystems API 300 mass spectrometer. High-resolution mass spectra were obtained by means of a JEOL JMS-HX110 mass spectrometer. Elemental analyses were carried out on a Heraeus CHN–O RAPID element analyzer.

A solution of pyrazol-5-amine derivatives (1a–1e, 1.0 equiv) and POCl$_3$ (1.2 equiv) in DMF solution (3 mL) at 30–40 ºC was treated with 100 W of microwave energy within 10–20 min. When the reaction was completed, the reaction mixture was concentrated, added to water (10 mL) and extracted with CH$_2$Cl$_2$ (4 × 20 mL). The organic extracts were washed with saturated NaHCO$_3$, dried over MgSO$_4$, filtered, and concentrated under reduced pressure. The residue solution was
purified by column chromatography on silica gel to give the corresponding methnimidamide products (2a–2e) in 81–94% yields.

Standard Procedure for the Synthesis of Pyrazolyl-2-azadiene Compounds (3a–3e)

A solution of pyrazol-5-amine derivatives (1a–1b, 1.0 equiv), POCl₃ (1.2 equiv) and pyridine (3.0 equiv) in DMF solution (3 mL) at 30–40 °C was treated with 100 W of microwave energy within 10–20 min. When the reaction was completed, the reaction mixture was concentrated, added to water (10 mL) and extracted with CH₂Cl₂ (4 × 20 mL). The organic extracts were washed with saturated NaHCO₃, dried over MgSO₄, filtered, and concentrated under reduced pressure. The residue solution was purified by column chromatography on silica gel to give the corresponding methnimidamide products (3a–3e) in 78–98% yields.

N’-(4-formyl-1,3-diphenyl-1H-pyrazol-5-yl)-N,N-dimethyl-methanimidamide (3a)

Calcd for C\(_{17}\)H\(_{14}\)BrN\(_3\)O; C: 57.32; H: 3.96; N: 11.80, Found: C: 57.28; H: 3.94; N: 11.81.

5-Amino-1-(4-bromophenyl)-3-(4-chlorophenyl)-1H-pyrazole-4-carbaldehyde (4e)

mp (purified by column chromatography on silica gel) 191–192 °C; \(^1\)H NMR (CDCl\(_3\), 200 MHz) \(\delta\) 5.97 (s, 2 H, NH\(_2\)), 7.42–7.48 (m, 4 H, ArH), 7.61–7.67 (m, 4 H, ArH), 9.82 (s, 1 H, CHO); \(^{13}\)C NMR (50 MHz, CDCl\(_3\)) \(\delta\) 104.8, 122.3, 125.4 (2 \(\times\) CH), 129.1 (2 \(\times\) CH), 128.7 (2 \(\times\) CH), 129.9, 133.2 (2 \(\times\) CH), 135.4, 135.8, 150.0, 152.5, 185.0 (CHO); IR (KBr) 3302 (m), 2920 (m), 2850 (m), 2368 (m), 1639 (m), 1492 (m), 1261 (m), 1153 (m), 1010 (m), 829 (m), 736 (m), 578 (m) cm\(^{-1}\); EIMS \(m/z\) (relative intensity) 379 (M+2, 25), 377 (100), 376 (M\(^+\), 52), 348 (6), 221 (3), 162 (10), 97 (13), 75 (13), 71 (20), 57 (29); Anal. Calcd for C\(_{16}\)H\(_{11}\)BrClN\(_3\)O; C: 51.02; H: 2.94; N: 11.16, Found: C: 51.03; H: 2.91; N: 11.12.
Section 5.3 Cell lines

Human non-small cell lung carcinoma (NCI-H661) was purchased from American Type Culture Collection (ATCC; Rockville, MD). T-cell leukemia (Jurkat) was obtained from Japanese Collection of Research Bioresources (JCRB) and nasopharyngeal carcinoma (NPC-TW01) was purchased from Bioresource Collection and Research Center (BCRC, Taiwan). All the tumor cell lines were maintained in either RPMI-1640 or Modified essential medium (MEM) supplied with 10% fetal bovine serum at 37°C in a humidified atmosphere of 5% CO₂/95% air in the present of penicillin and streptomycin.
Section 5.4 Growth inhibition assay

Logarithmic phase cells were seeded in a 96-well plate and incubated overnight prior to addition of the designated compounds. After incubation with different concentrations of the tested compounds for 72 h, cells were incubated with MEM containing 0.5 mg/mL MTT for 2 h. The conversion of MTT to formazan by metabolically viable cells was measured by the absorbance at 570 nm in a 96-well microtiter plate reader. The percentage conversion by mock-treated control cells was used to evaluate the effect of the chemicals on cell growth and to determine the concentration that inhibited 50% of growth (GI50).
